## Entrepreneurial Ecosystems in Small Towns: Franchise Chain Expansion

### Abstract

**Purpose:** This article seeks to identify the interrelationships of institutional factors that compose an entrepreneurial ecosystem (EE) in small towns that can potentially increase the attraction of franchises.

**Design/methodology/approach:** We analysed 728 small towns with franchise chains that do not belong to metropolitan regions and are limited to populations of up to 50,000 inhabitants. Secondary data are obtained from the Brazilian Institute of Geography and Statistics. The data analysis technique used is Poisson regression.

**Findings:** A higher number of employed persons (H1), a higher savings (H2), and a higher number of educational institutions (H4) correlates with more franchise chains in small towns. The availability of institutional support (H3) does not correlate with the number of franchise chains. Regarding the interrelationships between factors, the interactive effect between two constructs is determined to cause a decrease in franchise chains, whereas interrelating three factors raises the number of franchise chains ( $R^2 = 72.3\%$ ).

**Originality/value:** The contribution of this article is bringing EE to the debate of the institutional environment's impact on new businesses. EE adds to the debate examining the interrelationships between different institutional factors. An EE not only identifies the factors, but also examines the interdependence of these factors, which can potentially explain the attraction of franchise chains in small towns.

**Practical implications:** The analysis identifies some environmental factors to be considered in market prospecting by franchise chains' expansion managers. These factors constitute a relevant analytical model focused on the regional development of franchise chains.

**Social implications:** Social contributions are directed to public policy professionals responsible for regional economic development, as emerging markets demand actions to encourage job creation when confronted with high unemployment rates and dependence on the informal economy.

**Key Words:** Entrepreneurial Ecosystem; Regional Development; Small Town; Institutional Environment; Emerging Market; Franchise Chains.

## 1. Introduction

The franchise industry faces growth barriers, particularly in large cities and metropolitan areas, where expansion in the markets where a franchise operates must be controlled to avoid unnecessary competition between the units of the same chain. One solution for rational expansion involves adapting a franchise's business model to explore markets in smaller cities (Moita and Guerra, 2012; Melo, Delgado, Corrêa and Borini, 2020; Melo, Borini, Isaac and Corrêa, 2023). However, this is not a simple endeavor, as studies highlight the difficulties of establishing structured businesses in smaller cities (Kelly, Ruther, Ehresman and Nickerson, 2016; Dubois, 2016; Roundy, 2017; Roundy, 2018; Melo *et al.*, 2023). In particular, limitations in the institutional environment include restrictions among the consumer public, inadequate disposable incomes for consumption, lack of workforce training and business knowledge, limited networking between local entrepreneurs, competition with informal local competitors, and difficulties with logistics and overall infrastructure (Neo and

1  
2  
3  
4 Pow, 2015; Estrada, Sandu, Zrncic and McNulty, 2015; Roundy, 2017). These limitations  
5  
6 become more challenging for franchising in emerging markets (Boudreaux and Nikolaev,  
7  
8 2019; Lanfranchi, Melo, Borini and Telles, 2021; Lanfranchi, Strehlau, Borini and Melo,  
9  
10 2021; Melo, Carneiro-da-Cunha and Telles, 2021). There are several aspects of the  
11  
12 institutional environment that can constrain the expansion of franchises in small towns, and  
13  
14 examinations to determine the settings that attract franchises to small towns are still based on  
15  
16 the literature regarding the institutional environment.  
17  
18  
19

20  
21 However, the analysis of factors in the institutional environment can be restrictive in  
22  
23 understanding the attraction of new franchise units to small towns. The analyses of  
24  
25 institutional environment factors are static. They consider whether the factors are presented or  
26  
27 not. The literature needs to bring to the debate the concept of entrepreneurial ecosystem (EE).  
28  
29 EE is based on a biological metaphor, in which the interrelationship between participants in  
30  
31 an environment may be capable of promoting business activities, involving both the private  
32  
33 and governmental spheres. The result can enhance the growth of enterprises in geographic  
34  
35 boundaries, be they countries, regions, or cities (Audretsch & Link, 2012; Stam, 2015; Spigel,  
36  
37 2017; Acs, Stam, Audretsch & O'Connor, 2017).  
38  
39  
40

41  
42 The EE perspective assumes that the interrelationship between participants in an  
43  
44 economic environment could foster business activities (Stam, 2015; Spigel, 2017). This leads  
45  
46 to analyses of the interdependence of the attractive investment factors that are related to the  
47  
48 creation of businesses by entrepreneurs, including networks, leadership, finance, talent, new  
49  
50 knowledge, intermediate services, formal institutions, culture, physical infrastructure, and  
51  
52 demand (Stam, 2015; Stam and Spigel, 2018; Stam and Van de Ven, 2021; Leendertse,  
53  
54 Schrijvers and Stam, 2022). EE includes institutional factors, but places emphasis on the  
55  
56 interdependence of institutional factors for explaining the attraction of franchise chains to  
57  
58 small cities (Neo and Pow, 2015; Estrada *et al.*, 2015; Kelly *et al.*, 2016; Dubois, 2016;  
59  
60

1  
2  
3  
4 Roundy, 2017). When the EE is the focus of analyses the central point is not only the  
5  
6 institutional factors themselves, but whether the interrelationship of the institutional factors  
7  
8 that compose the EE of small towns can increase the attraction of franchise chains.  
9

10  
11 In this way, the article's objective is to show the importance of adding EE to the  
12  
13 discussion of the impact of the institutional environment on new franchises. To develop the  
14  
15 research, in addition to anchoring the article in the EE theoretical perspective, we adopt a  
16  
17 quantitative approach to analyze the associated hypotheses. The subjects of article are  
18  
19 franchise chains in small towns in Brazil. The use of Brazilian subjects is justified by the  
20  
21 country's characteristics of a large consumer market with 90% of its cities having less than  
22  
23 50,000 inhabitants, representing approximately 37% of Brazil's population (Vieira, Roma and  
24  
25 Miyazaki, 2020). The data analysis technique used is Poisson regression. The main result  
26  
27 confirms the importance of EE, demonstrating that the interactive effect between factors is  
28  
29 associated with an increased number of franchises in Brazil's small towns.  
30  
31  
32  
33

34 The main contribution of this article is to introduce the EE alongside the institutional  
35  
36 approach. In other words, to understand the interrelationship between various institutional  
37  
38 factors in EEs (Stam and Spigel, 2018; Vedula and Kim, 2019; Stam and Van de Ven, 2021;  
39  
40 Leendertse *et al.*, 2022). We introduce this theme of interdependence to the debate regarding  
41  
42 the competitiveness of franchise chains, where the institutional environment impact is already  
43  
44 well discussed (Melo, Borini, Oliveira Jr. and Parente, 2015; Melo, Ogasavara and Borini,  
45  
46 2019; Lanfranchi *et al.* 2021a; Lanfranchi *et al.*, 2021b; Melo *et al.*, 2020; Melo *et al.*, 2023).  
47  
48 Furthermore, by investigating the issue of small towns, we contribute to associated reflections  
49  
50 on regional development (Neo and Pow, 2015; Estrada *et al.*, 2015; Kelly *et al.*, 2016;  
51  
52 Dubois, 2016; Roundy, 2017; Roundy, 2018). In managerial terms, we contribute by  
53  
54 identifying how EEs can be important drivers for franchise managers when making their  
55  
56 choices to establish operations in new markets, and for public administrators regarding the  
57  
58  
59  
60

1  
2  
3  
4 importance of enhancing the institutional environment by developing effective policies to  
5 facilitate the interrelations of factors and establish vibrant EEs.

## 10 11 **2. Literature review** 12 13

### 14 15 16 *2.1. Entrepreneurship Ecosystem (EE)* 17

18 Multiple models list the factors that support regional entrepreneurial activity. As  
19 current studies acknowledge (Leendertse *et al.*, 2022; Kansheba and Wald, 2020), no  
20 consensus regarding a single instrument has been reached for measuring EE. Consequently,  
21 certain factors have greater relevance for certain ecosystems and business models (Corrente,  
22 Greco, Nicotra, Romano and Schillaci, 2019; Mungila Hillemane, 2020).  
23  
24  
25  
26  
27  
28

29 From a more recent perspective, Stam (2015), Stam and Spigel (2018), Stam and Van  
30 de Ven (2021), and Leendertse *et al.* (2022) propose an integrative model comprising 10 EE  
31 elements. These authors classify these elements into institutional arrangements (formal  
32 institutions, culture, and networks), resource endowments (physical infrastructure, demand,  
33 intermediaries, talent, knowledge, leadership, and finance), and the value created by  
34 entrepreneurs as an output of the EE. This model highlights the relevance of institutions in  
35 establishing the interrelationships between resources to generate value in the ecosystem, with  
36 networking as the provider of information flow and exchanges between participants.  
37  
38  
39  
40  
41  
42  
43  
44  
45  
46  
47

48 EE studies are guided by geographic dimensions, such as towns, cities, regions, and  
49 countries (Malecki, 2018). Among studies analyzing geographic delimitations, some authors  
50 restrict their regional analyses, assuming that entrepreneurs' actions are based on locale,  
51 which can yield greater accuracy in revealing the business policies adopted by entrepreneurs  
52 (Leendertse *et al.*, 2022). For example, Stam and Van de Ven (2021) analyze 12 regional  
53 subdivisions in the Netherlands, demonstrating three groups of interrelationships, including (i)  
54  
55  
56  
57  
58  
59  
60

1  
2  
3  
4 talent factors, entrepreneurial culture, and support services; (ii) knowledge and leadership  
5  
6 factors; and (iii) physical infrastructure and demand factors. Nevertheless, research gaps  
7  
8 remain in studies that purport to demonstrate differences between regions in the same country  
9  
10 (Alvedalen and Boschma, 2017). This opens space for research in countries with great  
11  
12 geographical extension and intense cultural and economic diversities, such as those in Latin  
13  
14 America (Leendertse *et al.*, 2022).  
15  
16  
17  
18  
19

## 20 21 2.2. Regional Development and Small Towns

22  
23 Such towns present additional challenges, as they often do not have conditions that are  
24  
25 common to large urban centers, such as population density, infrastructure, human resources,  
26  
27 and consumer markets. This regional differentiation is more complicated in small towns in  
28  
29 emerging markets, as there may be difficulties in raising funds, less diversified economies,  
30  
31 low public policy support, and lower quality networking, which make EE survival more  
32  
33 challenging (Neo and Pow, 2015; Estrada *et al.*, 2015; Roundy, 2017). However, small towns  
34  
35 can be promising sites of entrepreneurial activity and consequently in the development of  
36  
37 regional businesses; thus, there are research opportunities for understanding the particularities  
38  
39 involving EEs in small towns (Roundy, 2017; Kelly *et al.*, 2016; Dubois, 2016).  
40  
41  
42

43  
44 Roundy (2017) examines the characteristics of EEs in small towns. In the author's  
45  
46 conception, limitations of these ecosystems include a lack of specialized human resources,  
47  
48 less competitive markets due to smaller scale production, less infrastructure development,  
49  
50 lack of professional support from incubators and third parties, less financial flow and  
51  
52 consequent difficulty in fundraising. Nevertheless, such markets benefit from greater  
53  
54 consumer loyalty, as personal relationships are more informal than those in large cities, and  
55  
56 networking among participants tends to be stronger, given the greater proximity between  
57  
58 participants. However, research on the most prominent markets has occupied the vast majority  
59  
60

of studies, and this concentration limits our understanding of income and consumer behaviour impacts in small towns, of which only a few are known based on the accumulated academic knowledge (Roundy, 2018).

### 2.3. *Institutional Environment and Emerging Markets*

Studies that apply institutional theory as a basis (Raza, Muffatto, and Saeed, 2019; Atiase, Mahmood, Wang, and Botchie, 2018) demonstrate adherence to the EE approach, presenting multilevel analyses of institutions (regulatory, cognitive, and normative) and their interactions in these ecosystems. Such studies analyze the quality of the institutional environment and determine the optimal conditions for entrepreneurs.

Nevertheless, the relationship between EEs and institutional environments still lacks depth, including (i) understanding institutional changes and EEs' ability to absorb these changes to establish new business opportunities; (ii) identification of the human resources responsible for leadership in EEs and their ability to guide institutional impacts; (iii) determining the institutions that create obstacles in regional development and make successful EE functioning difficult (Alvedalen and Boschma, 2017; Boschma, 2017). The institutional characteristics in certain locations may be more conducive to entrepreneurship, leading to more effective regional development. Particularly in markets with weak formal institutions, there is a greater strength of entrepreneurs' informal social capital (Sine and David, 2010; Huggins, Thompson, and Johnston, 2012; Boudreaux and Nikolaev, 2019). This highlights the formal institutional characteristics in underdeveloped and emerging markets, as emerging market institutions are generally lower quality compared with developed markets (Boudreaux and Nikolaev, 2019; Khoury and Prasad, 2015). Therefore, examinations of the relationship between EE and the institutional environment must be expanded.

1  
2  
3  
4 Understanding the relationship between EEs and the institutional environments is an  
5  
6 even higher priority for franchises, and there is an absence of studies regarding this  
7  
8 phenomenon. In terms of the purpose of this article, some research is dedicated to  
9  
10 understanding the competitive dynamics of franchise chains in emerging markets (Lanfranchi  
11  
12 *et al.*, 2021a; Lanfranchi *et al.*, 2021b).  
13  
14  
15  
16  
17

#### 18 2.4. Entrepreneurship and Marketing (EM) 19

20 Entrepreneurship and marketing (EM) studies work on the particularities of these  
21  
22 activities linked to small- and medium-sized enterprises (SME) by understanding that  
23  
24 differences in the application of marketing exist compared to large companies. Sophisticated  
25  
26 marketing models in small companies have not shown promise when the particularities of  
27  
28 SMEs are not recognized. There is a strong dependence on the owner's knowledge, in an  
29  
30 environment with a limited presence of specialists, with generalist professionals prevailing.  
31  
32 This impacts these companies' reduced networking and low social insertion in the exchange  
33  
34 of knowledge (Jones and Rowley, 2011; Alqahtani and Uslay, 2023). In the study, we noted  
35  
36 the contribution of the franchise model for entrepreneurs. There is the benefit of belonging to  
37  
38 an extensive network of knowledge disseminated by the franchisor to its franchisees. This  
39  
40 configuration allows for greater identification and exploration of opportunities by working in  
41  
42 a network (Melo *et al.*, 2020; Melo *et al.*, 2023; Melo, Carneiro-da-Cunha and Telles, 2022).  
43  
44  
45  
46  
47

48 From an entrepreneurship perspective, studies involve understanding the  
49  
50 entrepreneur's profile and identifying opportunities, innovations, and new businesses  
51  
52 (Gilmore, 2011). For marketing researchers, the agenda focuses on creating, communicating,  
53  
54 and delivering value to consumers (Gundlach and Wilkie, 2009). Thus EM emerges from  
55  
56 this junction as they seek to expand their businesses, identifying opportunities to be explored  
57  
58 with innovations in their markets and value to their consumers (Most, Conejo and  
59  
60

Cunningham, 2018; Sadiku-Dushi, Dana and Ramadani, 2019; Homsy, Hashem and Freihat, 2020; Alqahtani and Uslay, 2023).

There are EM agendas that come close to the framework of this article's proposal on the expansion of franchise chains to small cities and the respective EE. These studies establish that EM deals with topics linked to the expansion of enterprises, prospecting and exploring business opportunities, creating networks, and delivering value to stakeholders (Hills, Hultman, Kraus and Schulte, 2010; Pane Hade, Kernek and Toombs, 2016; Alqahtani and Uslay, 2020; Morrish and Jones, 2020; Alqahtani and Uslay, 2023).

Being a field of study that is still recent in academia, because it combines two fields of study, this expansion of research presents even greater potential for development (Jones and Rowley, 2011; Lopes, Laurett, Antunes and Oliveira Jr., 2021). The literature indicates constructs to be explored in research on EM. For Jones and Rowley (2011), four perspectives are integrated: (i) *market orientation*, (ii) *customer orientation*, (iii) *entrepreneurial orientation*, and (iv) *innovation orientation*. These elements are very close to the constructs of Yadav and Bansal (2020), who focused on five research perspectives: (i) *entrepreneurial orientation*, (ii) *marketing orientation*, (iii) *innovation orientation*, (iv) *customer orientation*, and (v) *business performance*.

### 3. HYPOTHESES

#### 3.1. Market Environment

Consumer demand for products and services is one of the most frequently analyzed institutional factors in studies regarding the potential of EE. The rationale for this institutional factor is easily understood, as it is associated with the population's purchasing power. Markets with low consumption power have lower viability for formal enterprises. The metrics

1  
2  
3  
4 used to verify the potential of a regional market involve indicators related to the incomes,  
5  
6 employability, and size of the local population (Isenberg, 2010; Mack and Mayer, 2016; Stam  
7  
8 and Van de Ven, 2021; Leenderstse, Schrijvers and Stam, 2021).  
9

10  
11 When analyzing the characteristics of small towns in comparison to large cities,  
12  
13 additional challenges emerge from population limitations and the configuration of economic  
14  
15 strata. These population and economic restrictions tend to generate uncompetitive regional  
16  
17 markets, with low sector diversification that is restricted to essential consumption sectors. A  
18  
19 limited number of studies provide insightful information about the uniqueness of consumers  
20  
21 in small towns, encompassing their consumer behavior, impact of income, innovation  
22  
23 attraction, and preference for local brands (Roundy, 2017; Roundy, 2018).  
24  
25  
26

27 One of the metrics of analysis in small towns is local unemployment indicators. When  
28  
29 analyzing particularities regarding the sources of income in municipalities, it is possible to be  
30  
31 more exact in determining the potential of markets with population restrictions. Some studies  
32  
33 demonstrate the relationship between a population's employability and propensities toward  
34  
35 consumption, as the employed population has a greater consumption capacity (Carpenter and  
36  
37 Moore, 2006; Shugan, 2007; Melo *et al.*, 2020). Therefore, the following hypothesis is  
38  
39 proposed:  
40  
41  
42

43 *H1: Attraction of franchise chains to small towns is positively associated with the consumer*  
44  
45 *market environment of the entrepreneurial ecosystem.*  
46  
47  
48

### 49 3.2. Financial Environment

50  
51  
52 Local savings indicators signal a population's capacity for financial expenditure, on  
53  
54 the part of entrepreneurs and the consuming public. For the productive sector, these reserves  
55  
56 can be used to expand business. For the banking sector, it demonstrates a funding capacity  
57  
58 that can be converted into loans. From the perspective of households, it indicates consumption  
59  
60

1  
2  
3  
4 potential for various products and services (Lang, Ofek and Stulz, 1996; Aghion, Comin,  
5  
6 Howitt and Tecu, 2016; Malkina, 2019; Shaikh, 2021; Brazilian Entrepreneurial Cities, 2022).  
7  
8

9 Access to financial resources is relevant for creating and sustaining enterprises'  
10 operations. When examining the particularities of emerging markets, the prevalence of  
11 informal investors is notable, and individual savings investments are among the main sources  
12 of financial resources for Brazilian entrepreneurs (Criscuolo and Menon, 2015; Brazilian  
13 Entrepreneurial Cities, 2022; Stam and Van de Ven, 2021).  
14  
15  
16  
17  
18  
19

20 The experience of large enterprises in terms of potential financial resources differs  
21 from small enterprises' regional development, as access to equity funding, angel investors,  
22 and venture capital is not always attainable. Regional development is dependent on bank  
23 resources, local entrepreneurs' financial reserves, and the financial reserves of entrepreneurs'  
24 family members and friends. This mainly occurs in environments with institutional  
25 limitations, such as emerging markets where entrepreneurs face greater difficulties accessing  
26 capital (Robb and Robison, 2014; Boudreaux and Nikolaev, 2019).  
27  
28  
29  
30  
31  
32  
33  
34  
35

36 Financial access is another variable to be examined, as it promotes consumption by the  
37 population and is considered a positive factor for attracting business. There are greater  
38 financial restrictions in interior markets than in large economic centers (Melo *et al.*, 2020;  
39 Melo *et al.*, 2022). Given this situation, the following hypothesis is proposed:  
40  
41  
42  
43  
44

45 *H2: Attraction of franchise chains to small towns is positively associated with the financial*  
46 *environment of the entrepreneurial ecosystem.*  
47  
48  
49  
50

### 51 52 53 3.3. Institutional Support

54 Activities conducted by institutions that support regional entrepreneurship contribute  
55 to entrepreneurs' assistance and technical training, including legal, accounting, financial, and  
56 marketing advice, among others. In addition to such training, such organizations also increase  
57  
58  
59  
60

1  
2  
3  
4 opportunities to intensify networking among entrepreneurs, resulting in greater access to the  
5  
6 regional network of investors, suppliers, public representatives, and local stakeholders  
7  
8 (Isenberg, 2010; Eveleens, Van Rijnsoever and Niesten 2017; Goswami, Mitchell and  
9  
10 Bhagavatula, 2018; Roundy, 2017; Vendula and Kim, 2019; Van Rijnsoever, 2020;  
11  
12 Leendertse *et al.*, 2022).

13  
14  
15  
16 The actions to promote enterprises developed by supporting institutions include  
17  
18 initiatives such as tutoring, training, meetings, conferences, and startup weekends that can  
19  
20 intensify the network of relationships between entrepreneurs, orienting them as part of a local  
21  
22 business community, and enabling a greater exchange of experiences and understanding of the  
23  
24 dynamics of these ecosystems (Spigel, 2017; Ter Wal, Alexy, Block and Sandner, 2017; Stam  
25  
26 and Van de Ven, 2021).

27  
28  
29  
30 However, when analyzing the characteristics of small towns, a minimal number of  
31  
32 initiatives promote enterprises through technology parks, incubators, and business  
33  
34 accelerators. There is also a smaller network of relationships, as there are fewer participants in  
35  
36 these ecosystems compared with large cities. This is an additional challenge for entrepreneurs  
37  
38 in such locations, who must seek relationships and external support to build and expand their  
39  
40 ecosystem (Roundy, 2017; Ayatse, Kwahar and Iyortsuun, 2017; Eveleens *et al.*, 2017;  
41  
42 Leendertse *et al.*, 2022). Based on this information, the following hypothesis is proposed:

43  
44  
45  
46 *H3: Attraction of franchise chains to small towns is positively associated with the institutional*  
47  
48 *environment that supports the entrepreneurial ecosystem.*

### 51 52 53 3.4. Human Resources Environment

54  
55 Human resources are a constantly present factor of EE studies, and it is essential to  
56  
57 analyze the current capabilities of entrepreneurs and collaborators. From the perspective of  
58  
59 entrepreneurs, broader knowledge is required, encompassing leadership, negotiation, and  
60

1  
2  
3  
4 strategic skills and operational knowledge. To measure this construct, some studies use  
5  
6 education indicators at secondary and university levels (Isenberg, 2010; Boudreaux and  
7  
8 Nikolaev, 2019; Vedula and Kim, 2019; Leendertse *et al.*, 2022; Stam and Van de Ven,  
9  
10 2021).  
11  
12

13  
14 In international studies involving several countries, analyses related to human capital  
15  
16 highlight the need for complementary educational programs in emerging and developing  
17  
18 markets, due to existing inadequacy of the educational system in these countries (Galvão,  
19  
20 Ferreira, and Marques, 2018). These characteristics are intensified in emerging economies  
21  
22 when considering small towns, as there is less labor force availability in these locations than  
23  
24 large centers.  
25  
26

27  
28 Regarding the specificities of franchise chains, an established business model  
29  
30 facilitates the transfer of knowledge between units that are adaptable to local realities.  
31  
32 Franchisees are required to have local management skills for franchises, as determined by the  
33  
34 franchisor. Thus, franchise chains are capable of advancing local human capital skills through  
35  
36 technical training for both franchisees and employees to conduct franchised activities. This  
37  
38 characteristic of the franchise model can overcome existing deficiencies in the formation of  
39  
40 the operational workforce of the markets where the franchises operate (Melo, Carneiro-da-  
41  
42 Cunha and Borini, 2018; Santiago *et al.*, 2020; Melo, Carneiro-da-Cunha, and Telles, 2021).  
43  
44 Based on the above, the following hypothesis is proposed:  
45  
46

47  
48 *H4: Attraction of franchise chains to small towns is positively associated with the human*  
49  
50 *resources environment of the entrepreneurial ecosystem.*  
51  
52

### 53 54 3.5. Interrelationships

55  
56  
57 The interrelationships between the environmental factors of an EE have a greater  
58  
59 influence than the actions of the individual parts. We argue that the EEs of franchise chains in  
60

1  
2  
3  
4 small cities have some unique components, considering the nature of the franchise business  
5  
6 approach based on retail and pre-formatted models. The relationship between the consumer  
7  
8 market, consumption power, institutions supporting entrepreneurs, and workforce training are  
9  
10 some of the factors of EEs that are relevant to sustaining franchises in small towns (Isenberg,  
11  
12 2010; Mack and Mayer, 2016; Melo, Carneiro-da-Cunha and Borini, 2018; Stam and Van de  
13  
14 Ven, 2021; Leenderstse, Schrijvers and Stam, 2021; Melo, Carneiro-da-Cunha, and Telles,  
15  
16 2021).

17  
18  
19  
20 Market potential is related to a population's income capacity for consumption, and is  
21  
22 among the main factors of business attraction. This includes consumers with income from  
23  
24 professional occupations as well as savings and investments (Lang *et al.*, 1996; Aghion *et al.*,  
25  
26 2016; Malkina, 2019; Shaikh, 2021; Brazilian Entrepreneurial Cities, 2022).

27  
28  
29  
30 The institutional support structure for entrepreneurs is also among the necessary  
31  
32 elements for EEs. This factor has the benefit of supporting networking with other local  
33  
34 entrepreneurs. This element is relevant as it can enhance the commercial vision of franchisees  
35  
36 assessing commercial potential and the overlap of local adversities common to other traders  
37  
38 (Isenberg, 2010; Eveleens *et al.*, 2017; Goswami *et al.*, 2018; Roundy, 2017; Vendula and  
39  
40 Kim, 2019; Van Rijnsoever, 2020; Leendertse *et al.*, 2022).

41  
42  
43  
44 The availability of skilled labor is another element that could strengthen EEs in small  
45  
46 towns. Thus, potential local employees must have an educational precondition to capably  
47  
48 absorb the requirements of training and qualification by the franchisors (Melo, Carneiro-da-  
49  
50 Cunha and Borini, 2018; Santiago *et al.*, 2020; Melo, Carneiro-da-Cunha, and Telles, 2021).

51  
52 Given the interrelationships between these factors, the following hypothesis is proposed:

53  
54  
55 *H5: Attraction of franchise chains to small town is positively associated with the*  
56  
57 *interrelationships between the market, financial, institutional support, and human resources*  
58  
59 *environments of the entrepreneurial ecosystem.*  
60

1  
2  
3  
4 Given the arguments presented above, Figure 1 illustrates the research framework  
5  
6 developed for this article.

## 15 16 **4. Methodology**

### 17 18 *4.1. Data*

19  
20 The data obtained and investigated in this research are part of a collection available  
21  
22 from the Brazilian Institute of Geography and Statistics (IBGE Cities, 2021), including cities  
23  
24 with franchise chains that are not constituents of metropolitan regions, and limited to  
25  
26 populations of up to 50,000 inhabitants. According to the IBGE, such towns are conceptually  
27  
28 small cities (Vieira *et al.*, 2020). The list of cities with franchise chains was obtained through  
29  
30 a request to the Brazilian Association Franchising in 2021. The sample for this research  
31  
32 includes 728 small cities.  
33  
34  
35

36  
37 The relevance of research on franchises in small towns is justified, due to their  
38  
39 predominance in Brazil. The official data from the IBGE (Vieira *et al.*, 2020), demonstrate the  
40  
41 predominance of small towns in Brazil. There are 5,570 cities, of which 5,037 (90%) are cities  
42  
43 with less than 50,000 inhabitants, and around 37% of the Brazilian population is dispersed in  
44  
45 small towns. In addition, studies that analyze the performance of franchise chains in the  
46  
47 interior of Brazil are scarce and only apply the institutional environment perspective and not  
48  
49 EEs (Melo *et al.*, 2020; Melo *et al.*, 2023). Figure 2 shows Brazilian population cities map.

#### 4.2. Research Variables

The dependent variable is the number of franchise chains in the municipality, signaling the attractiveness of a municipality for different franchise chains (Melo *et al.*, 2023). The independent variables include (i) market, (ii) financial, (iii) institutional support, and (iv) human resources environments, which are key environmental variables for the development of regional businesses and the institutional environment for entrepreneurship (Isenberg, 2010; World Economic Forum, 2013; Stam, 2015; Spigel, 2017; Stam and Spigel, 2018; Vedula and Kim, 2019; Melo *et al.*, 2020; Melo *et al.*, 2023; Stam and Van de Ven, 2021; Leendertse *et al.*, 2022). The environmental factors were selected based on the characteristics of the business model based on the franchises, which is retail-based and owned by entrepreneurs (Melo *et al.*, 2020; Melo *et al.*, 2023). Thus, the selected factors concern the potential of the consumer market (market), the financial capacity for consumption (financial), the institutional support for entrepreneurs (institutional support), and the availability of labor for operation in the franchises (human resources). Table 1 presents descriptions of the variables and respective institutional environments.

-----  
Insert Table 1 here  
-----

#### 4.3. Analytical Procedures

The data analysis technique used is zero-truncated Poisson regression, as the dependent variable has count data (Agresti, 2002); in this case, the number of franchise chains in a municipality. The hypothesis tests considered probability values (p-value)  $< 0.05$  (\*), p-value  $< 0.01$  (\*\*), and p-value  $< 0.001$  (\*\*\*). The criterion of the predicted direction in the theoretical hypotheses ( $\beta$ ) is also considered to determine whether the influence of the

independent variables is positive (associated with an increased number of franchises,  $\beta > 0$ ) or negative (with a decrease,  $\beta < 0$ ).

To identify the optimal model and perform sensitivity analysis, some general adjustment tests are performed to compare the nested models (Wooldridge, 2012), such as the contrast between Akaike information criterion (AIC) levels and the proportion of explanation of the variability of the dependent variable (adjusted pseudo- $R^2$ ). The nonlinear terms of the independent variables already existing in the model are also added to minimize the possibility of bias in estimating the parameters by containing an omitted variable within the error term (Ramsey, 1969). Verification of the intensity of multicollinearity and heteroscedasticity was also tested (Breusch and Pagan, 1979; O'Brien, 2007), which can be circumvented by correcting standard errors (White, 1980).

The analyses are conducted using R software (R Core Team, 2013) and the RStudio visual interface (RStudio Team, 2020) with the Hmisc libraries (Hothorn *et al.*, 2022; Harrell Jr, 2021), to test the correlations; performance (Lüdecke, 2022) for some model tests and assumptions; rsq (Zhang, 2022), to calculate the adjusted pseudo- $R^2$  coefficients; and sandwich (Zeileis and Lumley, 2022) and lmtest (Hothorn *et al.*, 2022) to operationalize the analyses related to homoscedasticity.

## 5. Results

The first model (M1) is the most basic, while the last model (M7) is the most complex and represents the final version used for testing the hypotheses. M1 is composed only by the intercept, and M2 has the addition of the fixed effects by state. The addition of this variable is particularly important because it does not load the model with a very large number of cities and serves as a control for the size of the geographic context, which could introduce several aspects that may confound the main effect that we seek to measure.

1  
2  
3  
4 M3 adds all variables that test the hypotheses of interest. M4 is adjusted according to  
5  
6 the result of the previous model. The interactions (interrelationships) between the variables of  
7  
8 interest are added in M5. The main objective of investigating these interrelationships is to test  
9  
10 the joint effect of each of the hypotheses tested in the article. M5 only includes the pair-to-  
11  
12 pair interactions of the hypotheses that previously have some significance. M6 adds an  
13  
14 interaction between the variables that have statistical significance. Finally, quadratic nonlinear  
15  
16 effects are included in M7. This specification is essential for preventing possible significant  
17  
18 nonlinear effects from accumulating from the error term of the equation.  
19  
20  
21

22  
23 Regarding the general fit of the model, the AIC indicates that the inclusion of new  
24  
25 variables is responsible for reducing by almost half the errors found in the first model (AIC =  
26  
27 6,084) in comparison to the last one (AIC = 3,173). Regarding the explanation of the total  
28  
29 variability of the dependent variable, controlling for fixed effects is not responsible for adding  
30  
31 much information. Nevertheless, when adding both the variables that operationalize the  
32  
33 hypotheses and their interactions, an increase of more than 30% in each of the cases is  
34  
35 evident. Hence, most of the variability present in the dependent variable is explained by the  
36  
37 variables of interest (adjusted  $R^2 > 60\%$ ) to the detriment of the question of control or  
38  
39 complementary to the core of the article.  
40  
41  
42

43  
44 As expected, adding the variables that interrelate with the main effects of interest  
45  
46 reveals a considerable increase in collinearity between the variables (such as  $VIF > 5$ ), as a  
47  
48 portion of the same information present among the independent variables is also present in the  
49  
50 interactions. However, this addition remains relevant for explaining the phenomenon in  
51  
52 question, and does not present any significant problem for the interpretation of the parameters  
53  
54 (O'Brien, 2007), as there is no perfect multicollinearity (Wooldridge, 2012). Finally, a test is  
55  
56 performed to determine whether there is sufficient evidence of the presence of  
57  
58 heteroscedasticity (Breusch and Pagan, 1979). Except for the most basic models, the levels of  
59  
60

1  
2  
3  
4 variability of the independent variables are not homogeneous ( $p$ -value  $< 0.001$ ). To address  
5  
6 this limitation, the standard errors are corrected (White, 1980) and the results are presented in  
7  
8 Table 2.  
9

10  
11 Proxy variables representing the constructs described in the theoretical framework are  
12  
13 used to test the hypotheses. H3 regards the promotion of enterprises, which is the only  
14  
15 variable not associated with the number of franchise chains in municipalities ( $p$ -value  $> 0.05$ ).  
16  
17 For H1, the number of people employed in the municipality represents the environment of  
18  
19 market demand ( $p$ -value  $< 0.001$ , \*\*\*). For H2, the level of savings represents economic  
20  
21 activity and the financial environment ( $p$ -value  $< 0.01$ , \*\*). For H4, the number of secondary  
22  
23 education establishments represents professional training and the environment for developing  
24  
25 talent ( $p$ -value  $< 0.001$ , \*\*\*). These last three reveal strong statistical significance (at least  $p$ -  
26  
27 value  $< 0.01$ ) in all models, regardless of the variation in the interrelationships used in the  
28  
29 different specifications. It is also possible to determine whether the direction of the  
30  
31 interrelationships remains the same as that predicted in the literature; that is, an increase in  
32  
33 employed people (H1), savings (H2), or educational background (H4) is associated with an  
34  
35 increase in the number of franchise chains ( $\beta > 0$ ).  
36  
37  
38  
39  
40

41 We also test the nonlinear effects that our hypotheses could have. No significant  
42  
43 relationships were found for employed people ( $p$ -value  $> 0.05$ ) and level of savings ( $p$ -value  $>$   
44  
45  $0.05$ ), but significant and negative relationships were found for secondary education ( $p$ -value  
46  
47  $> 0.01$ , \*\*). This can be interpreted as meaning that investment in secondary education (H4) is  
48  
49 responsible for increasing franchise levels up to a certain threshold, at which an inflection  
50  
51 occurs, after which any further increase in educational support is associated with a decrease in  
52  
53 the number of franchise chains. This interrelationship presents an inverted U shape.  
54  
55  
56

57 Other nonlinear results test the interrelationships between the variables proposed in the  
58  
59 hypotheses. A general result that is consistently observed between M5 and M7 is that the  
60

interactions between employed people (H1) with savings (H2) or secondary education (H4) are associated with a decrease in the number of franchise chains in a municipality ( $\beta < 0$ ).

This clarifies that just having an increase in employed people (H1), whether this is interrelated with a level of savings (H2) or educational level (H4) is not enough to increase the number of franchise chains. In contrast, interacting the three variables reveals a significant marginal increase in the number of franchise chains in a municipality ( $\beta < 0$ ; p-value  $< 0.05$ , \*). Therefore, the interactive effect between just two constructs can generate a decrease, while interrelating empirically verifies an increase.

## 6. Discussion

The research carried out outlined the particularities of the environmental factors involving the attraction of franchise chains to EEs in small Brazilian cities. When analyzing the results, such locations stand out due to higher levels of employed workers, bank savings, and educational institutions. In turn, the attraction of franchises was not significant because of the presence of support institutions. Notably, there is a positive relationship in attracting franchises when three factors are interrelated, with a decrease when only two factors are interrelated. These findings differ from other research involving EEs. This is due to the various particularities of the sectors in which they operate, regional configurations, consumer demands, and the objectives of research involving EEs.

Classic studies involving EEs focused on analyzing the prevalence of technological sectors with global demands. These are ecosystems with products that have an international impact, not just local. The best-known case is Silicon Valley/United States (Saxenian, 1994; Kenney and Von Burg, 1999), however there are other relevant regional ecosystems, such as

1  
2  
3  
4 Kyoto/Japan (Aoyama, 2009), Arizona/United States (Mack and Mayer, 2016), Tel  
5  
6 Aviv/Israel (Klingler-Vidra, Kenney, and Breznitz, 2016), Edinburgh/Scotland (Spigel, 2016)  
7  
8 and Calgary/Canada (Spigel, 2017). There are particular characteristics of each ecosystem,  
9  
10 which can transcend the perimeters of local operations, depending on the ecosystems'  
11  
12 business dynamics. This calls for increasingly regionalized analysis of EEs (Leendertse *et al.*,  
13  
14 2022; Stam and Van de Ven, 2021).  
15  
16

17  
18 Furthermore, recent studies have been conducted in ecosystems in both American and  
19  
20 European regions.. These results indicate that younger American ventures benefit from the  
21  
22 expertise of more experienced entrepreneurs despite institutional factors (Vedula and Kim,  
23  
24 2019).  
25  
26

27  
28 In the case of Europe, studies show that most urbanized regions had better scores compared to  
29  
30 rural regions and Eastern Europe. This suggests a particular understanding of small cities and  
31  
32 less economically developed regions (Leendertse *et al.*, 2022).  
33  
34

35  
36 Therefore, given the regional particularities and the businesses analyzed, generalizing  
37  
38 based on the results of the research is difficult. However, the research provides strong  
39  
40 evidence that environmental factors are business attractors.  
41  
42

## 43 **7. Conclusion**

### 44 *7.1. Theoretical Implications*

45  
46  
47  
48 The main theoretical contribution of this research is the identification of EE factors in  
49  
50 small towns that are interrelated to the presence of franchise chains in an emerging market.  
51  
52 This complements studies on *EEs* (Isenberg, 2010; World Economic Forum, 2013; Stam,  
53  
54 2015; Stam and Spigel, 2018; Vedula and Kim, 2019; Stam and Van de Ven, 2021;  
55  
56 Leendertse *et al.*, 2022; Mohammadi and Karimi, 2022), the *regional development of small*  
57  
58 *towns* (Neo and Pow, 2015; Estrada *et al.*, 2015; Kelly *et al.*, 2016; Dubois, 2016; Roundy,  
59  
60

1  
2  
3  
4 2017; Roundy, 2018), the *institutional environment of emerging markets* (Sine and David,  
5  
6 2010; Huggins *et al.*, 2012; Khoury and Prasad, 2015; Melo *et al.*, 2015; Melo, Ogasavara  
7  
8 and Borini, 2019; Boudreaux and Nikolaev, 2019; Lanfranchi *et al.*, 2021a; Lanfranchi *et al.*,  
9  
10 2021b), the *expansion of franchise chains in inland markets* (Moita and Guerra, 2012; Melo *et*  
11  
12 *al.*, 2020; Melo *et al.*, 2023), and *EM* (Jones and Rowley, 2011; Gilmore, 2011; Pane Haden,  
13  
14 Kernek and Toombs, 2016; Most, Conejo and Cunningham, 2018; Sadiku-Dushi, Dana and  
15  
16 Ramadani, 2019; Yadav and Bansal, 2020; Alqahtani and Uslay, 2020; Lopes *et al.*, 2021;  
17  
18 Alqahtani and Uslay, 2023). Specifically, these contributions indicate a lack of relevance of  
19  
20 local development institutions, as franchise chains may lower franchisee entrepreneurs' need  
21  
22 for such support, given the advisory skills and market intelligence provided by franchisors.  
23  
24  
25

26  
27 Another contribution is correlating the interrelationships between employed people,  
28  
29 savings, and educational background with the increase in the number of franchise chains.  
30  
31 However, there is an inflection point at which educational investment is linked to the  
32  
33 increased franchise chains. This may be related to employability options sought by high  
34  
35 school graduates, as well as the saturation level of local market for franchises.  
36  
37  
38

39 The third contribution reveals the interrelationships between employed people with  
40  
41 savings or educational training, which are associated with reductions in franchise chains in  
42  
43 municipalities, indicating that only an increase in employed personnel, whether interrelated  
44  
45 with level of savings or educational training, is not enough to increase franchise chains.  
46  
47  
48

49 The fourth contribution indicates that when interrelating the three environmental  
50  
51 factors (employed people, savings, and secondary education), there is a marginal increase in  
52  
53 the number of franchise chains in a municipality. This also demonstrates that more complex  
54  
55 relationships are required to establish attractive regional development for franchises in small  
56  
57 towns.  
58  
59  
60

1  
2  
3  
4 There is a fifth contribution aimed at EM studies based on the constructs by Jones and  
5  
6 Rowley (2011) and Yadav and Bansal (2020). This involves five orientations: (i)  
7  
8 *Entrepreneurial orientation*, deals with the proactiveness of franchise chains in the search for  
9  
10 opportunities in new markets, including the attitude of entrepreneurs toward establishing  
11  
12 franchises in these small towns; (ii) *Market orientation*, the requirement of franchise chains to  
13  
14 shape their businesses and consequently the marketing mix for operations in small markets,  
15  
16 including the strengthening of business networks with local entrepreneurs aiming to explore  
17  
18 these regional particularities; (iii) *Innovation orientation*, the establishment of a franchise in a  
19  
20 small town with a mix of innovations, given the modeling of these businesses with  
21  
22 contemporary marketing mixes, they tend to be superior points of sale to pre-existing models  
23  
24 in small towns; (iv) *Customer orientation*, brand equity efforts by franchise chains,  
25  
26 technological actions in digital marketing on social networks, alongside the franchise chain's  
27  
28 know-how in working on relationships and value generation concepts and; (v) *Performance*,  
29  
30 the expansion of franchise chains to small towns involves expanding the scale capacity of  
31  
32 these networks, by expanding into these markets, the network increases its bargaining power  
33  
34 with suppliers. Thus, there are several contributions and intersections when studying the  
35  
36 entrepreneurial ecosystem of small cities for franchise chains and the respective studies in  
37  
38 EM.  
39  
40  
41  
42  
43  
44  
45

46 Alongside these contributions to EM studies, we note the filling of the research gap  
47  
48 identified by Eggers, Niemand, Kraus, and Breier (2020) and Lopes *et al.*, (2021) by  
49  
50 presenting emerging perspectives that are still little explored. This contribution concerns the  
51  
52 work in business networks in influencing EM actions. This becomes clear when we talk about  
53  
54 the expansion of franchise chains and the attraction of EEs. Another research gap filled  
55  
56 highlighted by Alqahtani and Uslay (2023) as promising themes to be developed in EM,  
57  
58  
59  
60

1  
2  
3  
4 involves the empirical application in emerging markets, EM and networking, the influence of  
5  
6 EEs, and the use of quantitative data.  
7  
8  
9

## 10 11 *7.2. Managerial and Social Implications* 12

13 Management contributions are addressed to franchise chain expansion managers.  
14  
15 These analyses identify some critical environmental factors to be considered in prospecting  
16  
17 plans in small towns. The understanding of environmental factors as well as the  
18  
19 interrelationships between these factors is relevant for expansion managers. This analytical  
20  
21 model could produce more reliable conclusions for determining the location of franchises in  
22  
23 expansion plans.  
24  
25

26  
27 Social contributions are directed toward public policy managers responsible for  
28  
29 regional economic development to promote entrepreneurship and the local business  
30  
31 environment. In emerging markets, high unemployment rates and dependence on informal  
32  
33 economies are endemic economic realities. This requires government officials to promote job  
34  
35 creation, at their various levels of action, whether federal, state, or municipal. Consequently,  
36  
37 the promotion of public policies to support the development of EEs is one of the alternatives  
38  
39 for regional development, as franchise-based businesses may generate jobs and income for  
40  
41 populations in the interior of the country.  
42  
43  
44  
45  
46  
47

## 48 *7.3. Research Limitations and Future Studies* 49

50 Some limitations are related to the institutional factors verified in this research,  
51  
52 specifically (i) market does not measure the income of the employed population, but is  
53  
54 restricted to measuring the proportion of the population that is employed; (ii) financial,  
55  
56 considering only savings in banks, excludes financial reserves in real estate and other assets;  
57  
58 (iii) institutional support does not include the purpose of the development agencies, but only  
59  
60

1  
2  
3  
4 the existence of such public institutions; and (iv) human resources does not measure the  
5  
6 number of high school graduates, but only the number of educational institutions.  
7

8  
9 Opportunities for future studies include the following topics involving small towns: (i)  
10 investigation of other institutional factors and interrelationships in EEs; (ii) analysis between  
11 regional clusters to identify the characteristics and spillover effects of these national  
12 ecosystems; (iii) sectoral studies within the franchising sector, with the objective of  
13 identifying segments with superior business modeling; (iv) verifying the correlation between  
14 franchise fees and attractiveness in small towns to determine related investment patterns; and  
15  
16 (v) choice of other factors determining the EE, as mentioned in the theoretical models, in  
17 alignment with the availability of data by official bodies.  
18  
19  
20  
21  
22  
23  
24  
25  
26

27 Furthermore, alongside the suggestions mentioned, there is a recommendation for  
28 specific future studies on EM; in this case, the identification of innovations and the impact on  
29 regional markets by local franchisees in conjunction with franchisors. This can help deepen  
30 the perspective on marketing orientation, customer orientation, entrepreneurial orientation,  
31 innovation orientation, and performance (Jones and Rowley, 2011; Roundy, 2018; Yadav and  
32 Bansal, 2020). Finally, we addressed the inclusion of quadratic terms to minimize the bias of  
33 omitted variables. However, we discovered exciting results about the nonlinear effects to  
34 respond to a methodological concern and to represent the hypotheses in combining the proxies  
35 for ecosystems. The results obtained are highly encouraging and pave the way for further  
36 investigation, especially by moving beyond the mindset of linear relationships.

Figure 1: Research framework

**Table 1:** Variable descriptions

ENVIRONMENT	Market	Financial	Institutional Support	Human Resources
<b>VARIABLE</b>	Employed people	Savings	Fostering ventures	Secondary education
<b>DESCRIPTION</b>	Measured by the percentage of people employed in a municipality, which is useful in understanding the economically active population in a municipality. This indicator signals the potential consumer market based on the population with formal income.	Measured by financial savings reserves in bank accounts in a municipality. This indicator signals consumption potential based on the population's financial reserves. The banked population is considered.	Measured by the number of programs to promote local enterprises. This is an institutional indicator that represents public actions to support entrepreneurs in a municipality.	Measured by the number of secondary education units, as an indicator of secondary education training of the local workforce. As franchises operate in the commerce sector, this level of education aligns with the required capabilities.
